WHAT HAVE WE LEARNED FROM THIS EXERCISE?

The guidelines provided for the Hackathon Project have introduced us to a variety of concepts. Having to implement these concepts have acquainted us with concepts such as the Hybrid framework which includes the Page Object Model pattern, Data driven library creation using Apache POI.

It has made us proficient in using the basic Selenium and TestNG frameworks. The use of Maven has shown us to liberate the project off of any dependency issues and to simplify the build process.

The implementation of the Jenkins server as mentioned in the project scope has introduced us to its basic utilisation which further triggers our curiosity to delve further into its uses. The implementation of Selenium Grid taught us how to run our test scripts parallelly in different environments.

We also learned how to run our test scripts on the Jenkins server from an online code repository like GitHub.

OVERALL EXPERIENCE

The making of the project has imbibed in us the experience of implementing our acquired theoretical concepts in practical projects. We now have attained and experienced the challenges of completing a project in a given timeline, even if in a comparatively smaller scale.

Since it was group project, it also provided us with hands-on experience of working in a team and accomplishing a set of predefined milestones within a given timeline.
